BABS DIGITAL INNOVATIONS & LEARNING PLATFORM (BDIP)

Artificial Intelligence Hub

Use intelligent tools responsibly to support people and work.

Purpose

The BDIP AI Hub brings together AI-enabled services that help users discover information, work with documents, learn, analyse content, and automate suitable tasks. AI is a capability within the wider ecosystem—not a replacement for evidence, professional judgement, or human accountability.

Core capabilities

- Natural-language processing and conversational assistants
- Semantic search and intelligent recommendations
- Document summarization and information extraction
- Classification, prediction, and machine-learning workflows
- Generative AI for drafting, exploration, and prototyping
- Workflow automation and decision-support interfaces

Operating workflow

Define the task → select an appropriate tool → provide authorized context → review the output → verify important claims → monitor risks.

Expected contribution

More accessible information, assisted analysis, reduced repetitive work, and new digital services with human oversight.

Connections within BDIP

Learning personalization; Research support; Data Science; Knowledge discovery; Applications; Responsible-AI governance.
